

What is claimed is:

- 1                    1.        A method of moving a volume of a reaction mixture, comprising:  
2                    introducing a first volume of a first fluid into a first channel segment, the first fluid  
3                    comprising an environmental control reagent; and  
4                    flowing a first volume of a second fluid into the first channel segment, the second  
5                    fluid comprising the reaction mixture.
- 1                    2.        The method of claim 1, wherein the first volume of the first fluid is  
2                    introduced into the first channel segment after the first volume of the second fluid is flowed through  
3                    the first channel segment.
- 1                    3.        The method of claim 2, further comprising flowing a volume of a first  
2                    volume of a third fluid through the first channel segment after the first fluid is flowed through the  
3                    first channel segment.
- 1                    4.        The method of claim 1, wherein the second fluid comprises a first test  
2                    compound.
- 1                    5.        The method of claim 4, wherein the second fluid comprises at least a first  
2                    component of a biochemical system.
- 1                    6.        The method of claim 1, wherein the environmental reagent comprises a  
2                    degassing fluid.
- 1                    7.        The method of claim 6, wherein the degassing fluid comprises a fluid that is  
2                    not gas saturated.
- 1                    8.        The method of claim 6, wherein the degassing fluid comprises a fluid having  
2                    less than 90% gas saturation.

- 1 9. The method of claim 6, wherein the degassing fluid comprises a fluid having  
2 less than 80% gas saturation.
- 1 10. The method of claim 6, wherein the degassing fluid comprises a fluid having  
2 less than 60% gas saturation.
- 1 11. The method of claim 6, wherein the degassing fluid comprises a fluid having  
2 less than 50% gas saturation.
- 1 12. The method of claim 6, further comprising degassing the first fluid  
2 immediately prior to the step of flowing the first volume of first fluid through the first channel  
3 segment.
- 1 13. The method of claim 12, wherein the degassing step comprises heating the  
2 first fluid.
- 1 14. The method of claim 12, wherein the degassing step comprises subjecting the  
2 first fluid to a negative pressure.
- 1 15. The method of claim 1, wherein the first fluid comprises a channel surface  
2 modifying reagent.
- 1 16. The method of claim 15, wherein the surface modifying reagent comprises a  
2 surface adsorbing polymer.
- 1 17. The method of claim 16, wherein the surface adsorbing polymer comprises a  
2 silica adsorbing polymer.
- 1 18. The method of claim 1, wherein the first fluid comprises a viscosity adjusting  
2 reagent.

1 19. The method of claim 1, wherein the first fluid comprises a complexing  
2 reagent.

1 20. The method of claim 1, wherein the first fluid comprises a reaction inhibiting  
2 reagent, and the second fluid comprises at least a first reactant.

1 21. The method of claim 20, wherein the reaction inhibiting reagent comprises an  
2 inhibitor of a reaction involving the at least first reactant.

1 22. The method of claim 21, wherein the first reactant comprises a first enzyme,  
2 and the inhibitor inhibits an action of the enzyme.

1 23. The method of claim 21, wherein the first reactant comprises a specific  
2 binding pair of reagents, and the inhibitor inhibits binding of a first member of the binding pair to  
3 the second member of the binding pair.

1 24. The method of claim 23, wherein the specific binding pair comprises one or  
2 more of an antibody/antigen pair, a complementary nucleic acid pair, a nucleic acid binding  
3 protein/nucleic acid pair, and a receptor/ligand pair.

1 25. A microscale channel, comprising:  
2 a first fluid region disposed therein, the first fluid region comprising at least one  
3 environmental control reagent; and  
4 a second fluid region disposed therein, the second fluid region comprising at least a  
5 first reactant.

1 26. The microscale channel of claim 25, wherein the first and second fluid  
2 regions are adjacent to each other within the first channel.

1 27. The microscale channel of claim 25, wherein the second fluid region is  
2 bounded on both sides within the channel by the first fluid.

1                    28.     The microscale channel of claim 25, wherein the second fluid comprises a  
2 first test compound.

1                    29.     The microscale channel of claim 28, wherein the second fluid comprises at  
2 least a first component of a biochemical system.

1                    30.     The microscale channel of claim 25, wherein the environmental reagent  
2 comprises a degassing fluid.

1                    31.     The microscale channel of claim 30, wherein the degassing fluid comprises a  
2 fluid that is not gas saturated.

1                    32.     The microscale channel of claim 30, wherein the degassing fluid comprises a  
2 fluid having less than 90% gas saturation.

1                    33.     The microscale channel of claim 30, wherein the degassing fluid comprises a  
2 fluid having less than 80% gas saturation.

1                    34.     The microscale channel of claim 30, wherein the degassing fluid comprises a  
2 fluid having less than 60% gas saturation.

1                    35.     The microscale channel of claim 30, wherein the degassing fluid comprises a  
2 fluid having less than 50% gas saturation.

1                    36.     The microscale channel of claim 25, wherein the first fluid comprises a  
2 channel surface modifying reagent.

1                    37.     The microscale channel of claim 36, wherein the surface modifying reagent  
2 comprises a surface adsorbing polymer.

1                    38.     The microscale channel of claim 37, wherein the surface adsorbing polymer  
2 comprises a silica adsorbing polymer.

1                    39.     The microscale channel of claim 25, wherein the first fluid comprises a  
2 viscosity adjusting reagent.

1                    40.     The microscale channel of claim 25, wherein the first fluid comprises a  
2 complexing reagent.

1                    41.     The microscale channel of claim 25, wherein the first fluid comprises a  
2 reaction inhibiting reagent, and the second fluid comprises at least a first reactant.

1                    42.     The microscale channel of claim 41, wherein the reaction inhibiting reagent  
2 comprises an inhibitor of a reaction involving the at least first reactant.

1                    43.     The microscale channel of claim 42, wherein the first reactant comprises a  
2 first enzyme, and the inhibitor inhibits an action of the enzyme.

1                    44.     The microscale channel of claim 42, wherein the first reactant comprises a  
2 specific binding pair of reagents, and the inhibitor inhibits binding of a first member of the binding  
3 pair to the second member of the binding pair.

1                    45.     The microscale channel of claim 44, wherein the specific binding pair  
2 comprises one or more of an antibody/antigen pair, a complementary nucleic acid pair, a nucleic  
3 acid binding protein/nucleic acid pair, and a receptor/ligand pair.

1                    46.     A method of preventing bubble formation in a fluid containing microchannel  
2 structure, comprising:  
3                    providing a first fluid in the first microchannel, the first fluid having a first dissolved  
4 gas concentration; and  
5                    maintaining the first fluid at a first temperature and pressure once the first fluid is  
6 introduced into the microchannel, the first temperature and pressure being sufficient to prevent  
7 bubble formation within the first fluid having the first dissolved gas concentration.

1           47.     The method of claim 46, further comprising providing a second fluid having  
2 a second dissolved gas concentration within the first microscale channel, wherein the first  
3 temperature and pressure and the first dissolved gas concentration in the first fluid are sufficient to  
4 absorb sufficient gas from the second fluid in order to prevent bubble formation from the second  
5 fluid having the second dissolved gas concentration under the first temperature and pressure.

1           48.     The method of claim 47, wherein the step of providing the first fluid in the  
2 first microchannel having a first dissolved gas concentration comprises elevating a temperature of  
3 the first fluid to a temperature greater than the first temperature prior to introducing the first fluid  
4 into the first microscale channel.

1           49.     The method of claim 47, wherein the step of providing the first fluid in the  
2 first microchannel having a first dissolved gas concentration comprises subjecting the first fluid to a  
3 pressure lower than the first pressure prior to introducing the first fluid into the first microscale  
4 channel.

1           50.     The method of claim 46, wherein the first fluid is heated to a temperature at  
2 least about 5°C higher than the first temperature, prior to introducing the first fluid into the first  
3 microchannel.

1           51.     The method of claim 46, wherein the first microchannel has at least one  
2 cross-sectional dimension between 0.1 and 100  $\mu\text{m}$ .

1           52.     A method of preventing bubble formation in a fluid containing microchannel,  
2 comprising:  
3           maintaining a first fluid at a first temperature prior to introducing the first fluid into  
4 the microchannel;  
5           applying a vacuum to the first microchannel to draw the first fluid into the first  
6 microchannel; and  
7           maintaining the first fluid at a second temperature once the first fluid is introduced  
8 into the microchannel, the second temperature being less than the first temperature.
